- 1) Sequences that match at the level of 99-100% also named *A. subpediades* (JN684790.1), *A. semiorbicularis* (AY194536.1), and *A. arenicola* (JN684805.1), which are synonyms of *A. pediades*.
- 2) Match at the level of 99-100% also with an individual sequence of *P. fasciata* (AB158635.1) – an Asian species occurring in China and Japan.
- 3) Match at the level of 99% also with individual sequences: *A. subfloccosus* - AY484698.1 (European species, known in countries such as Denmark, Czech and Ukraine) and *A. subrufescens* - AY484674.1 (species known in North and South America, but also Western Europe). However, the origin of the material indicates that the most probable identity of the sample is *A. bisporus*.
- 4) Match at the level of 99-100% also with sequences of *L. fallax* (KC581340.1); however, this is a species occurring only in North America.
- 5) Match at the level of 97-98% also with sequences of *Tricholoma mongolicum* (KC413941.1); however, this is a species occurring only in Asia.
- 6) Match at the level of 99-100% also with sequences of the closely-related species *M. puellaris* (JQ683121.1), originating from Armenia.
- 7) Sequences in GenBank are labelled with the synonymous name *B. erythropus*.
- 8) Match at the level of 99-100% also with an individual sequence of *R. occidentalis* (AY228349.1); however, this is a species occurring exclusively in North America.
- 9) Match at the level of 98-99% also with an individual sequence of *A. gemmata* (AF335440.1) originating from North America (possible error in GenBank database).
- 10) *A. excellens* (synonym *A. urinascens var. excellens*), and *A. nivescens* (synonym *A. osecanus*) are species occurring in Europe. *A. albolutescens* is a species occurring in North America. All the mentioned species are related and belong to one section (together with *A. sylvicola*) (Geml J, Royse DJ. Molecular phylogeny and cultivation of Agaricus species. In: Proceedings of the IV International Conferenceon Mushroom Biology and Mushroom Products; 2002 Feb 20–23; Cuernavaca, Mexico; p. 111–20.)
- 11) The closest sequences in GenBank are labelled with the synonymous name *L. deliciosus* var. *deterrimus*.
- 12) Sequences match at the level of 99-100%, also labelled with synonymous names *L. callitrichum* (AY538829.1), *L. percandidum* (AY538828.1), and *L. roseotinctum* (AY538826.1).
- 13) Match at the level of 99%, also with an individual sequence of *B. promontorii* (DQ112621.1); however, this is a species occurring exclusively in South Africa.
- 14) Match at the level of 99%, also with an individual sequence of *T. bufonium* (AY462030.1), which is a species that is very closely related to *T. sulphureum*. According to the work of Comandini et al. (Comandini O, Haug I, Rinaldi AC, Kuyper TW. Uniting Tricholoma sulphureum and T. bufonium. Mycol Res. 2004;108:1162-71. Medline:15535067 doi:10.1017/S095375620400084X), they are synonyms.
- 15) Sequences match at the level of 99% also labelled with the synonymous name *Phlebia acerina* (AB210080.1).
- 16) *A. sinapina*, *A. calvescens* – species occurring in North America, *A. lutea* (synonym *Armillaria gallica*) – known species occurring in Europe and North America
- 17) Genus *Kwoniella* encompasses five currently known species of mushrooms from the order Tremellales, closely related to the genus *Filobasidiella*. These are saprobiontic microscopic fungi that do not form fruiting bodies (41,42,43,44).
- 18) *Amanita velosa* is a species occurring in North America.
- 19) Match at the level of 99% also with an individual sequence of *Morchella esculenta* (JQ691498.1) – evidently erroneously labelled sequence.
- 20) Match at the level of 99-100% also with sequences of *Agaricus californicus* (e.g. FJ755229.1); however, it is a species that is known from North America.
- 21) Match at the level of 99% also with sequences of species: *A. gemina* (AY213556.1), *A. sinapina* (AY213565.1) and *A. calvescens* (AY213565.1); however, these are species occurring exclusively in North America.
